QSAC FAQ's

Q: How fast do they go?

A: These cars are geared to go between 40 and 60mph depending on the track size and configuration. They can reach speeds of well over 80mph in a straight line, but the radios can only maintain a 1000 foot range. After that the car would not be under control.

Q: How much do they cost?

A: You can buy a used car for about \$1000 and get great deals on additional parts and supplies with it. New cars range from \$1500 to \$3000 minus electronics and radio. A good radio with all the servos will cost about \$300. The initial cost for Quarter scale is a tad more than other smaller scale racing. However the cost to maintain and be competitive is lower over time.

Q: How much do they weigh?

A: Stock Cars are a minimum of 30lbs and Sprint Cars are a minimum of 24lbs.

Q: What kind of fuel do you use?

A: We use C16 racing fuel to prevent vapor lock due to heat, but any regular pump gas will work. It is a 2 cycle motor so you have to add 2 cycle oil.

Q: Where do you race these things?

A: These cars were originally made for racing in a parking lot. However there are purpose built tracks all over the country. They are mostly asphalt tracks, but there are several dirt tracks popping up.

Q: How long are the races?

A: Races vary depending on the event. There are 500 lap events, but most of the time we race 100 to 300 lap features. Usually there are 2 - 3 heats leading up to the feature of 50 laps each.
